● AI ENGINEER @ ISD

Hryhorii Manaienkov

AI Engineer · ex-Team Lead · Java/Angular, .NET

manaenkov.gregory@gmail.com · hman.pro · linkedin.com/in/hryhorii-manaienkov-9b317ab7 · github.com/ManGregory

I build AI agents into the software development process. At ISD I'm rolling out an agentic SDLC on Claude Code, where an agent takes an issue all the way to a reviewed pull request. It rests on 14 years of production engineering, six of them as a team lead.

IMPACT

how my reach grew

ENGINEER 2015–2020

Senior on clinical software

Grew to senior on the LIS genetics module, where results have to be exactly right, and took on its most complex workflows.

TEAM 2020–2023

A team through a stack change

Team lead of 8–13 people. Moved the whole team from C#/.NET desktop to a Java/Angular web product; led my area on emergency support and client go-lives.

PRODUCT 2023–2025

First client go-live

Took our team's part of the Results area live with its first client and fixed its performance bottlenecks, mostly in Oracle. Other LIS teams adopted my Grafana dashboards.

COMPANY 2025–2026

AI for the whole company

Introduced GitHub Copilot in my team, then ran the company-wide intro to AI in development for 300+ people, in English. Since June 2026 building the agentic SDLC full time; its AI review has covered 400+ pull requests.

EXPERIENCE

git log --graph

Jun 2026 – now **CURRENT**

AI Engineer · ISD

- Designing and rolling out an agentic SDLC at ISD: an agent takes an issue through planning, tests, implementation, review, QA and docs to a pull request, on Claude Code, GitHub Spec Kit and GitHub Actions.
- Built its AI code review, used voluntarily across the company: 400+ pull requests reviewed, 3,000+ findings, about 2,000 of them fixed, around 1–2% false positives.
- Built the measurement loop: a job runs three times a day to score fixed findings and false positives and to track adoption.

May 2022 – Jun 2026

Team Lead / Full Stack Developer · ISD

- Led my team of 8–13 people from the C#/.NET desktop genetics module to the Results area of LIS, a Java/Angular web product for lab results, and coached it through the new stack.
- Took our team's part of the product live with its first client; led my area on emergency support and client go-lives.
- Fixed performance bottlenecks in 2023–2025, mostly in Oracle: execution plans and query optimization.
- Built Grafana dashboards for the Results area that other LIS teams adopted.
- Introduced GitHub Copilot in the team with the product's first custom instructions; in 2026 ran the company-wide intro to AI in development for 300+ people, in English.

Feb – Sep 2020

Course Instructor · Hillel IT School

- Taught C#/.NET courses, from fundamentals to students' first projects.

Oct 2015 – May 2022

.NET Developer → Team Lead · ISD

- Built and maintained the LIS genetics module, a desktop app for genetic test workflows, results processing and reporting, where clinical data has to be exactly right.
- Grew to senior level and became the team's lead in 2020.

- On emergency support on-call from 2017, 2–4 weeks a year, resolving urgent customer issues.

C# · .NET · WinForms · SQL

Jun 2012 – Oct 2015

Software Engineer · PJSC KZRK

- Built and maintained the company's in-house ERP in Delphi: budgeting, tenders, procurement.

Delphi · SQL

PROJECTS

how they work

ISD · INTERNAL

Agentic SDLC

Autonomous bug fixes and features: open an issue, assign the agent, and it carries the work to a reviewed pull request.

PIPELINE	Plan, then a critique of the plan. Reproduce the bug, or write failing tests and invariants for a feature. Implement, then a post-implementation slot (docs, simplification). AI code review plus an external reviewer, QA, and an ADR for the decision.
BUILT ON	GitHub Spec Kit, Claude Code in GitHub Actions, GitHub Projects. Every step is templated and logged on the issue and the pull request.
STATUS	Works end to end for bug fixes; features work with some limits.
NEXT	Close the loop: open issues automatically from review logs (missed and wrong findings) and let the pipeline fix them, so products partly maintain themselves for obvious defects and simple features.

ISD · INTERNAL

AI code review

Comments on pull requests; engineers decide what to fix. Used voluntarily across the company.

THREE ANGLES ON CODE	An architecture overview; a focused review of risky spots found with a defect dictionary; and an unfocused whole-file read that catches what the focused pass was not told to look for, usually 1–2 more likely bugs.
BEYOND THE CODE	Checks changes against requirements and docs from the issue tracker over MCP. A second MCP server over an internal code graph maps the changed code to affected requirements and test cases; the model filters them into a regression checklist.
MEASURED	400+ pull requests and 1,000+ commits reviewed; 3,000+ findings, about 2,000 fixed (the rest are follow-ups or minor); false positives around 1–2%. A job scores this retrospectively three times a day and tracks adoption. In a separate test on 25 known bugs, the review caught 13.

SKILLS

by area

AI engineering
Agentic SDLC, Claude Code, Claude API, MCP, GitHub Spec Kit, multi-agent review, context engineering, LLM evaluation

Backend
Java, Spring Boot, C#, .NET, REST APIs

Frontend & desktop
Angular, TypeScript, WinForms, Delphi

Data & performance
Oracle (execution plans, query tuning), SQL, T-SQL

Infrastructure
GitHub Actions, Docker, Kubernetes, Helm, Prometheus, Grafana

Leadership
Team leadership, mentoring, technical training and talks, incident response

CERTIFICATIONS

Prometheus and Grafana · robot_dreams	Oct 2025
Oracle SQL Performance Tuning Masterclass · Udemy	Nov 2023
